Group Participation Evaluation:

Tristan Challener, Group #2

My group consisted of myself, Adam Wechter, Jake Ballinger, and Erich Harkema. We spent the laboratory session getting eclim set up and initializing our BitBucket repository. We were not able to get :JavaDocComment to work during the laboratory, though we did get eclim running and :ProjectCreate was working. We agreed to all meet up on Friday to continue our work.

On Friday, it turned out that Jake and Erich both could not stay for more than around half an hour. Fortunately, Adm had already figured out how to get JavaDocComment working so we set that up for the rest of us during the time we could all be together. After Jake and Erich left, Adam and I continued working and together managed to fix the defects in Kinetic. Additionally, we discovered that the reason that we were getting less than 100% coverage in our classes was that we weren't testing the constructors. After adding those tests, we were confident that we had completed the majority of the difficulties associated with this assignment.

Adam, Jake, and I met one last time on Tuesday to put together all of our deliverables and verify that everything was complete. Jake was assigned to complete the first two deliverables (the written explanation parts), and Adam and I worked together to finish up our test suite. I organized all of the necessary files into our git repository, then pushed everything to BitBucket.

Overall, Adam and I did the majority of the work. What remained was done by Jake (the written deliverables). Erich did very little; he did not even meet with us during the given class time on Tuesday. Aside from Erich, we worked well together and divided up the work without any problems.
